To whom it may concern,

I'm a Senior Frontend Engineer with 7 years of production experience building React and TypeScript applications for enterprise SaaS platforms. I'm reaching out because I'm actively exploring new opportunities, and I wanted to share a bit about the work I've been doing at SwiftConnect, where I've owned the frontend architecture, component systems, and real-time integrations for an access management platform used across thousands of enterprise accounts.

At SwiftConnect I've taken on more than typical frontend scope. I architected two SDK libraries a Node.js SDK and a React SDK both distributed as private NPM packages and sold to third-party customers integrating our API into their own frontends. I built and maintain a Storybook-documented component library that cut duplicate frontend code by roughly 40% across teams. I also led performance work across Core Web Vitals, wired Sentry with source map tracking and alert routing, and set up a React-based SendGrid email templating pipeline that removed manual template management entirely. Most recently I've been building custom MCP servers that connect Storybook, Figma, and GitHub directly into developer workflows, reducing cross-functional revision cycles by around 35%.

Beyond my day job, I've been pushing into full-stack and LLM integration work. I built and shipped an Ask AI feature for my portfolio from scratch: a FastAPI backend in Python integrating Groq's llama-3.3-70b model, Upstash Redis for caching repeated questions, IP-based rate limiting, and a structured prompt pipeline that grounds all answers in real resume data. The React frontend handles cold-start wakeup, surfacing backend error messages, and a full chat UI with typing indicators, source dropdowns, and keyboard shortcuts. It's portfolio-grade rather than production-scale, but it covers the full integration surface from prompt design to cache invalidation to graceful error handling in the client.

I've also shipped a full-stack real-time chat app (React 19, Socket.IO, React Native, shared Express backend) and an interactive math visualization platform with Web Worker-offloaded rendering across 17 graph types. Both are live and on GitHub. They reflect the kind of depth I bring to frontend work not just getting things on screen, but thinking carefully about state architecture, render performance, and code that other engineers can work in comfortably.

I'd welcome the chance to talk about how my background might fit what you're building. Happy to share more context or jump on a quick call at your convenience.

Regards,

Shaikh Zeeshan Murshed
